## Molded Case Circuit Breaker

### MCCB UNSX Series

### Excellent performance

UNSX dual rotary contact structure and the energy release system to ensure stable and reliable protection, and has excellent current-limiting characteristics.

Transparent aluminum cover protects your trip unit from settings, rotary handle, motor operation mechanism, etc. can be installed.

### Compliance with standards

International standards

IEC60947-1: general rules

IEC60947-2: circuit breakers

IEC60947-4: contactors and motor starters

IEC60947-5.1: control circuit devices and switching elements; automatic control components.

### National standards

GB14048.1: general rules GB14048.2: circuit breakers

Working environment The altitude belows 2,000m;

Circuit Breaker may be used between -25°C and +70°C. For temperatures higher than 40°C (65°C for circuit breakers used to protect motor feeders), devices must be derated;

It can withstand the impact from humid air, salt spray, oil mist and mold;

It should be installed in places with no danger of explosion, no conductive dust, and no substance enough to corrode metal or damage the insulation;

In places with no rain and snow erosion;

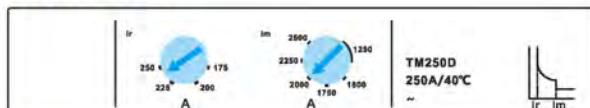

Pollution degree 3;

Installation category III.

## Functions and characteristics

	UNSX 100~250	UNSX 400~630
Item No.	S-Type	
Number of poles	3-pole,4-pole	
Control	Manual	With toggle/with direct or extended rotary handle
Connections	Fixed	front connections
	Plug-in	front connections/rear connections
Electrical Characteristics as per IEC60947-2 and EN60947-2		
Rated current(A)	In	40°C
Rated insulation voltage(V)	Ui	750
Rated impulse withstand voltage(kW)	Uimp	8
Rated operational voltage(V)	Ue	AC50/60Hz 690V
Utilization category		A
Operation performance	Mechanical Electrical	8500 1500

## Chart B-1

## Protection

Overload protection: Thermal protection( $I_r$ )

Thermal overload protection based on a bimetal strip providing an inverse timecurve  $I_r(t)$ , corresponding to a temperature rise limit. Above this limit, the deformation of the strip trips the circuit breaker operating mechanism.

**Overload protection has the following characteristics:**

- $I_r$  that can be adjusted in amps from 0.7 to 1 times the rating of the trip unit(16A to 250A),
- corresponding to settings from 11 to 250A for the range of trip units.

**Anon-adjustable time delay.**

Short-circuit protection: Magnetic protection( $I_m$ )Short-circuit protection with a fixed or adjustable pick-up  $I_m$  that initiates instantaneous tripping if exceeded.

- TM-D: fixed pick-up, $I_m$ , for 16-160Aratings and adjustable from 5 to 10 xIn for200 and 250A ratings.

## Chart B-2

LED indications

# UNION ELECTRICS

## Molded Case Circuit Breaker

### Protection

Settings are made using the adjustment dials with fine adjustment possibilities. Overload protection: long time protection( $I_r$ )

Inverse time protection against overloads with an adjustable current pick-up  $I_r$  set using a dial and a non-adjustable time delay  $t_r$ .

Short-circuit protection: Short-time protection with fixed time delay( $I_{sd}$ )

Protection with an adjustable pick-up  $I_{sd}$ . Tripping takes place after a very short delay used to allow discrimination with the downstream device.

Short circuit instantaneous protection:(ii)

Instantaneous short-circuit protection with a fixed pick-up.

Vigicompact UNSX100-630 circuit breakers with earth-leakage protection Addition of the Vigi modules does not alter circuit-breaker characteristics:

- Compliance with standards;
- Degree of protection, class II front-face insulation;
- Isolation function, compliance with IEC60947-2;
- Electrical characteristics;
- Trip-unit characteristics;
- Installation and connection modes;
- Indication, measurement and control auxiliaries;
- Installation and connection accessories.

### Vigi earth-leakage protection modules

#### Compliance with standards

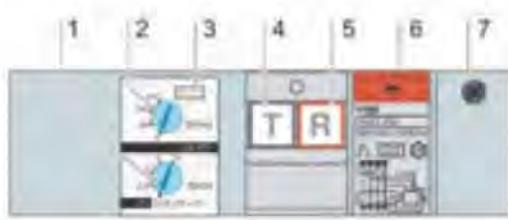

- IEC60947-2, appendix B.
- IEC60255-4 and IEC60801-2~5.
- IEC60755, class A, immunity to DC components up to 6mA.
- Operation down to -25°C as per VDE664.

#### Remote indications

Vigi modules may be equipped with an auxiliary contact(SDV) to remotely signal tripping due to an earth fault.

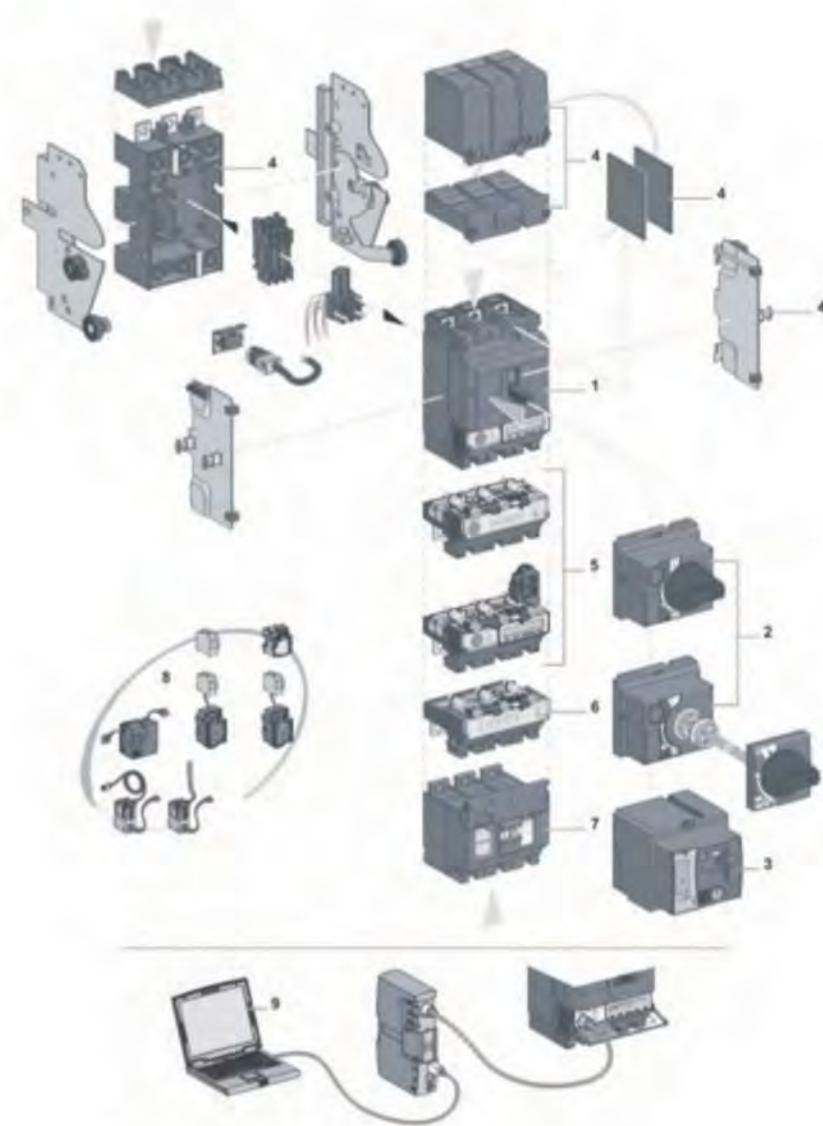

#### Power supply

Vigi modules are self-supplied internally, they continue to function even when supplied by only A, C two phases.

1. Sensitivity setting
2. Time-delay setting(distinguish earth fault protection)
3. Lead-seal fixture for controlled access to settings
4. Test button simulating an earth-fault for regular checks on the tripping function.
5. Reset button(reset required after earth-fault tripping)
6. Rating plate
7. Housing for sDv auxillary contact

## Mounting on plate

## The main function of circuit breaker

UNSX series of MCCB offers comprehensive function choice. These functions can be used easily, and can be completely applied into every field safely.

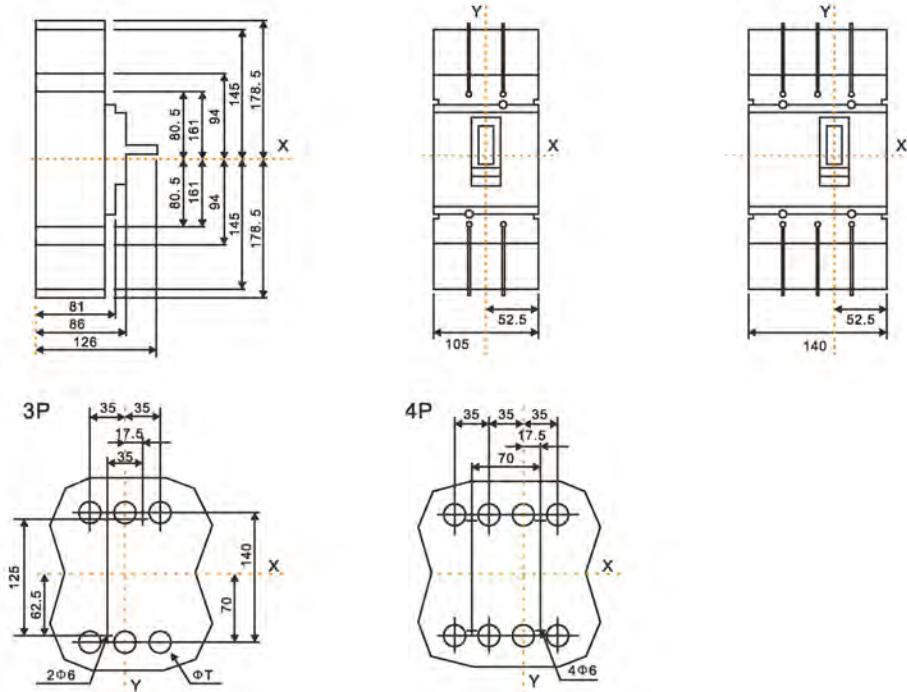

- Toggle handle
- Rotary handle
- Motor operation mechanism
- Related accessories
- Mic electronic release unit
- TM-D Thermal Magnetic release unit
- vigi ground-fault protection module
- Mic related accessories of release unit
- Mic maintenance interface

### Standards

UNM4 series circuit breakers and auxiliaries comply with the following international standard:

**IEC/EN 60947-1**

Low-voltage switchgear and controlgear-Part 1:General rules

**IEC/EN 60947-2**

Low-voltage switchgear and controlgear-Part 2:Circuit-breakers

### UNM4 MCCB(Standard Of Environment For MCCB Application)

1)Ambient Temperature: -5 degrees~+55 degrees, average no more than 40 degrees within 24 hours.

2)Relative Humidity:45~85%.

3)Altitude:The altitude of the installation does not exceed 2000m.

4)Atmosphere Conditions:Where excessive steam,oil steam,smoke,dust,salt and other corrosive materials do not exist.

### Type Guide

UNIQ MCCB	Type	Rated Current			Breaking Capacity	Pole
		63	125	250		
	F(Fixed type)	16A	16A	100A	S	2-pole
	A(Adjustable type)	20A	20A	125A	H	3-pole
	L(Leakage type)	25A	25A	160A		4-pole
		32A	32A	180A		
		40A	40A	200A		
		50A	50A	225A		
		63A	63A	250A		
			80A			
			100A			
			125A			
			160A			

Remark:

UNM4 (125A) has 2-pole/3-pole/4-pole;

UNM4 (250A) has 3-pole/4-pole.

## Product Characteristics

### Security

The module housing is made of high-strength heat-resistant material. Achieve electrical isolation between phases and operating mechanisms. To ensure the safety of users and eliminate phase-to-phase current short circuit.

### Reliability

The closed structure design further protects the rotating and moving conductors from the external environments and makes the electrical contacts more reliable.

### High Performance

Gas-producing material is adopted in the module to produce gas flow when the gas-producing short-circuit current is generated. Obviously improve the effect of air blowing, to achieve a better current limiting effect, the product break index increased significantly.

## Molded Case Circuit Breaker

### Built-out Accessory

### Built-Out Accessory

#### Inter-phase Insulation Barrier

- Inter-phase insulation barrier is a kind of safety accessory, which is used for the insulation between the phases. It can guarantee the best insulation of the wiring terminal.
- They are compatible with both the short terminal covers. And it is ok to mount the inter-phase insulation barrier in both UNM1A&UNM1Lseries and every phase(2P,3P and 4P).

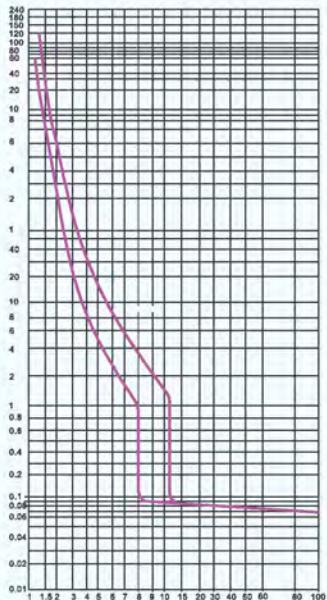

#### Short Terminal Cover

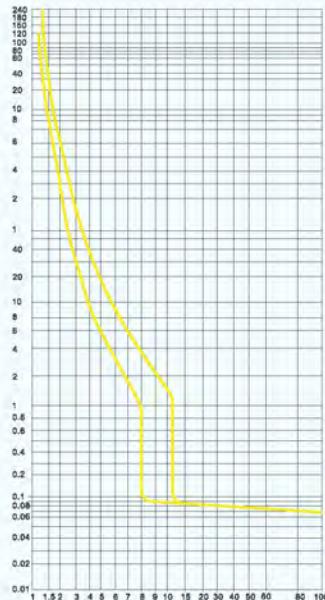

- Short terminal cover is insulation accessory ,which is used to prevent the direct contact between the terminal in circuit breaker and other live parts to ensure the safety of the users.
- All the terminal cover is designed with holes which can be knocked off to connect the cables of various wires and the copper platens.
- They are compatible with both the interphase insulation barrier and phase & ampere frames.

## Characteristics Curve

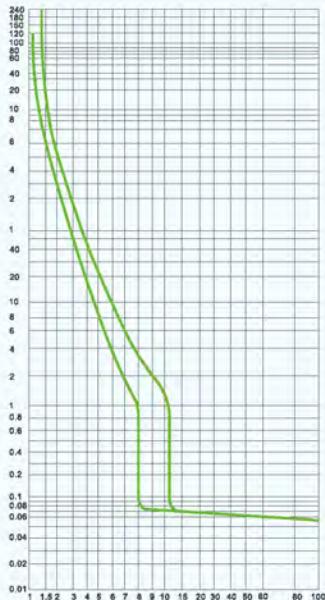

Rated current 16A~63A

Rated current 80A~125A

Rated current 160A~250A

• Remark: When  $I_n \leq 32$ ,  
 $I_t = 400A(\pm 20\%)$ .

• Remark: When  $I_n > 32$ ,  
 $I_t = 10 * I_n (\pm 20\%)$

• Remark: When  $I_n > 32$ ,  
 $I_t = 10 * I_n (\pm 20\%)$

## Characteristics Curve Table

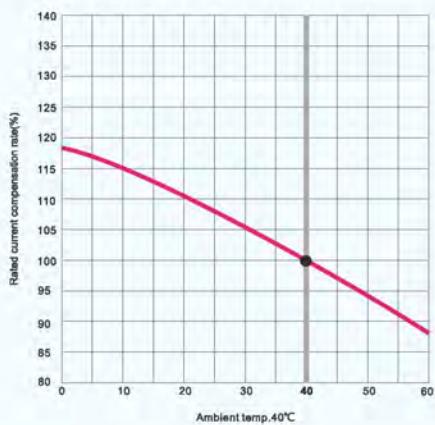

Test No.	Load current	Rated current	Initial state	Time limit to trip	Estimated result

## Molded Case Circuit Breaker

### MCCB UNM3-F Series

### The general of UNM3-F series moulded case circuit breaker

UNM3-F series moulded case circuit breakers(hereafter simply referred to as circuit breakers) are one of the new type breakers which have been developed with international advanced design and manufacturing technology. The rated insulation voltage of the breakers is 800V. In the circuit of AC50Hz, the rated working voltage 690V or below(UNM3-F63 400V) and the rated working current up to 800A, the breakers are suitable for infrequent turn-on or turn-off and infrequent motor starting-up. The breakers have overload, short-circuit and under-voltage protection performances so as to protect the circuit and the power equipment from damage.

According to the rated ultimate short-circuit breaking ability(Icu), the breakers are classified into three kinds of types C(basic type), L(standard type), M(second high type). Those breakers have the advantages such as small size, high breaking ability, short arc, anti vibration.

The breakers could be installed vertically (upright) or horizontally (transverse).

The breakers have disconnecting function, its corresponding symbol is shown as "—>—".

The breakers comply with the demands of the following standards: GB/T14048.2.

### Application conditions for operation and installation

Ambient temperature : -5°C~+40°C.

Elevation of installation site: <=2000m.

Relative humidity: not exceeding 50% at the maximum ambient temperature of +40°C. With the lower temperature, higher humidity would be permitted. E.g. when the relative humidity is 90% at the ambient temperature of 20°C, special measures should be taken to solve the dews on the surface, which would appear due to the temperature change.

Pollution protection: 3 grade.

Breakers pass the GB/T2423.10 which can tolerate the mechanical vibration(frequency: 2Hz~13.2Hz, displacement: ±1 and frequency: 13.2Hz~100Hz, acceleration: ± 0.7g).

Installing categories: III for the main circuits; II for auxiliary circuit and control circuit without connecting with the main circuit.

Breakers can be used in electromagnetic environment A.

Humid and tropical type (TH) breakers pass the GB/T2423.4, which can tolerate the influence of damp air, salt mist, oil mist and mould.

Breakers should be installed in the place without any explosive medium, conductive dust and can not corrode metal and destroy the insulation.

The installation site would not be invaded by rain and snow.

Storage condition: Ambient temperature is -40°C~+70°C.

## Molded Case Circuit Breaker

### MCCB UNM1-L Series

### Standards

UNM1-L series circuit breakers and auxiliaries comply with the following international standard:

**IEC/EN 60947-1**  
Low-voltage switchgear and controlgear-Part 1:General rules

**IEC/EN 60947-2**  
Low-voltage switchgear and controlgear-Part 2:Circuit-breakers

### UNM1-L MCCB(Standard Of Environment For MCCB Application)

- 1)Ambient Temperature: -5 degrees~+55 degrees, avarage no more than 40 degrees within 24 hours.
- 2)Relative Humidity:45~85%.
- 3)Altitude:The altitude of the installation does not exceed 2000m.
- 4)Atmosphere Conditions:Where excessive steam,oil steam,smoke,dust,salt and other corrosive materials do not exist.

### Type Guide

UNM1	Type	100	Rated Current 250	400	630	Breaking Capacity	Pole

## MCCB UNES-F Series

### Application and range of application

The UNES-F series plastic outer covering type circuit breaker (hereafter refers to as circuit breaker), is this company uses the international advanced design, one of the technique of manufacture development, development new circuit breakers Its fixed isolation voltage is 690v, is suitable in exchanges 50Hz, fixed working voltage 400V and below. Rated current to 800A circuit as frequent changeover gum less frequent motor starter. The Circuit breaker with overload, short circuit protection device, and less voltage protection circuit and power equipment are not damaged.

## Application and scope

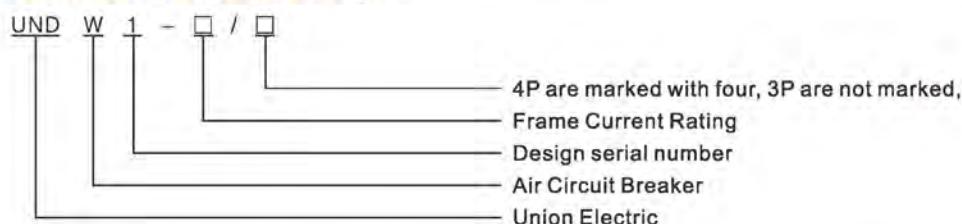

UNDW1 series Intelligent Air Circuit Breaker (hereinafter referred to as circuit breaker) is applicable to the distribution network with AC 50 Hz, rated working voltage 400V, 690V, rated working current 6300A and below. It is used to distribute electric energy and protect lines and power equipment from overload, undervoltage, short circuit, grounding and other faults. The circuit breaker adopts intelligent controller with precise selective protection and multi-function, with complete protection functions, which is especially suitable for the distribution network which needs to improve the reliability of power supply and avoid unnecessary power outage. Among them, 2h and 3H intelligent controllers have communication interface, which is convenient to connect with field bus, and can realize four remote functions of "telemetry", "remote regulation", "control" and "remote communication", and meet the requirements of control automation. Leakage protection can be realized by configuring leakage current transformer and corresponding intelligent controller.

The circuit breaker with rated working current of 1000A and below can also be used as overload, short circuit, undervoltage and ground fault protection of motor in AC 50 Hz and 400 V network, and can be used for infrequent starting of motor under normal conditions.

The products have passed the national compulsory "CCC" certification.

The circuit breaker has isolation function, and the symbol is "—/—"

## Model and meaning

## The circuit breaker meets the following standards

- ◆ IEC60947-1 and GB/T14048.1 general principles for low voltage switchgear and controlgear
- ◆ IEC60947-2 and GB/T14048.2 low voltage switchgear and control equipment low voltage circuit breakers
- ◆ IEC60947-4-1 and GB/T14048.4 low voltage switchgear and control equipment electromechanical contactors and motor starters
- ◆ GB/T/T2421.1 overview and guidelines for environmental testing of electrical and electronic products
- ◆ GB/T14597 climatic and environmental conditions of electrical products at different altitudes

## Installation environment requirements

The circuit breaker shall be installed in a dry, dust-free, corrosive gas free and explosive hazardous medium free environment without impact. If the environment can not meet this condition, the protection level of the complete equipment should be improved accordingly. The specific requirements are shown in the table below:

Project	Standard
Ambient Temperature	-5°C to +40°C, the 24hour average value does not exceed + 35°C, and the ambient temperature is not greater than + 40°C. The capacity reduction coefficient should refer to the manual
Relative Humidity	When the maximum temperature is + 50°C, the relative humidity of air is not more than 50%. Higher relative humidity can be allowed at lower temperature, for example, 90% relative humidity can be allowed at 20°C
Altitude	≤2000m, Refer to the specification for derating factor exceeding 2000m
Installation Requirements	Vertical inclination of circuit breaker installation≤5°
Class Of Pollution	III
Use Category	Intelligent universal circuit breaker: B
Protection Level	The circuit breaker is installed in the cabinet room with a door frame, and the protection grade reaches Ip40

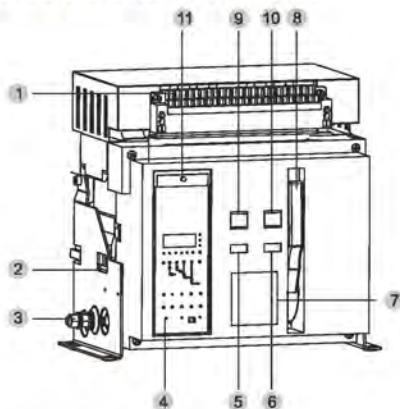

# UNION ELECTRICS

## Intelligent Air Circuit Breaker

### Preparation before installation

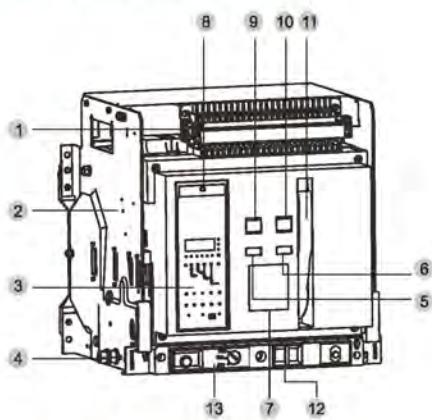

Before installation, the insulation resistance of circuit breaker shall be checked with 500VDC megger according to regulations. The ambient temperature of  $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$  and relative humidity of 50% ~ 70% shall not be less than  $500\text{m}\Omega$ . Insulation resistance test parts are: when the circuit breaker is closed, between each phase and ground; when the circuit breaker is open, between each phase and each pole.

## Intelligent Air Circuit Breaker

### Over current protection function

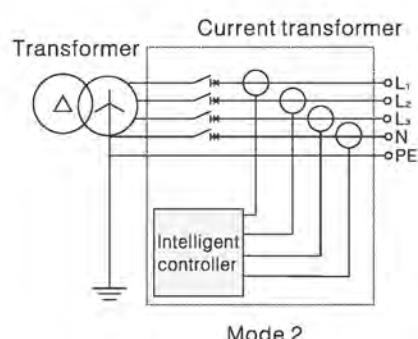

#### ◆ Particularity of long time delay, short time delay, instantaneous and grounding protection

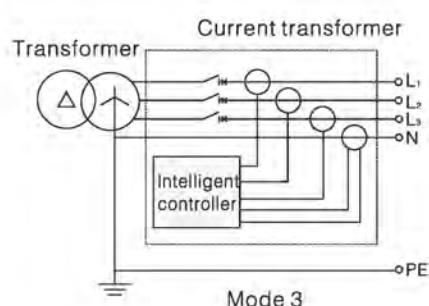

Polar fault protection mode:

- Mode 1: UNDW1 three pole circuit breaker is selected in TN-C, TN-C-S and TN-S distribution systems without additional external neutral line n current transformer.
- The vector sum of three-phase current is taken as the ground fault protection signal.
- The protection feature is time limit or inverse time limit protection.

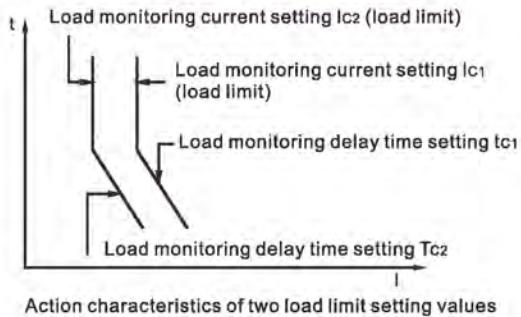

- Mode 2: UNDW1 four pole circuit breaker is selected in TN-S distribution system.
- The ground fault protection signal is the sum of three-phase current and N-phase current vector.
- The protection features are time limit or inverse time limit protection.

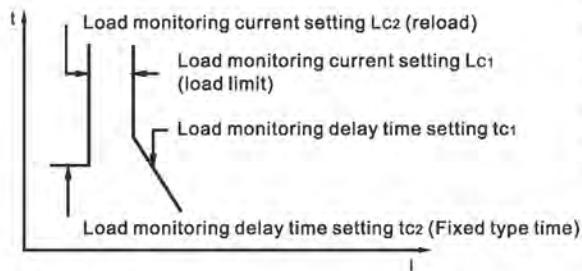

- Mode 3: UNDW1 three pole circuit breaker is selected in TN-S distribution system.
- The external neutral line n current transformer is used for ground fault protection (connected to No.25 and No.26 secondary circuit terminals), and the maximum distance between the installation site of the transformer and the open circuit is 2m.
- The ground fault protection signal is the sum of three-phase current and N-phase current vector.
- The protection feature is time limit or inverse time limit protection.

## Load monitoring function

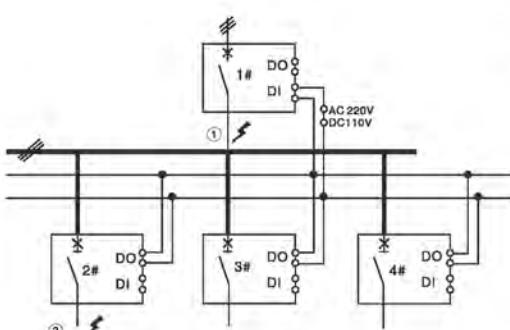

Action characteristics of two load limit setting values

A load limit, an action characteristic of reloading the setting value

- It is used to monitor the subordinate unimportant load and ensure the power supply of the main system;
  - There are two ways of load monitoring, one of which can be selected by users. The setting value of load monitoring current is  $I_{C1}$  and  $I_{C2}$ , generally  $I_{C1} \geq I_{C2}$ ;
  - Mode 1: it can control two lower level loads. When the operation current of the main circuit successively exceeds  $I_{C1}$  and  $I_{C2}$ , the contact signal will be sent out after delaying  $t_{C1}$  and  $t_{C2}$  respectively, and the controller will send instructions to cut off the two controlled loads.
  - Mode 2: only one lower level load is controlled. When the operating current of the main circuit exceeds  $I_{C1}$ , the contact signal will be sent after  $t_{C1}$  delay, and the controller will send instructions to cut off the load. If the operating current of the main circuit is lower than  $I_{C2}$  and the duration is  $t_{C2}$  after the load is disconnected, the controller can send a signal again to command the disconnected load to switch on (reload) and restore the power supply of the load.
- The load monitoring signals (1) and (2) corresponding to  $I_{C1}$  and  $I_{C2}$  are respectively output contact signals through the secondary circuit terminal of the circuit breaker. When the signal is sent out, it is indicated by the LED of the intelligent controller.

## Regional interlocking

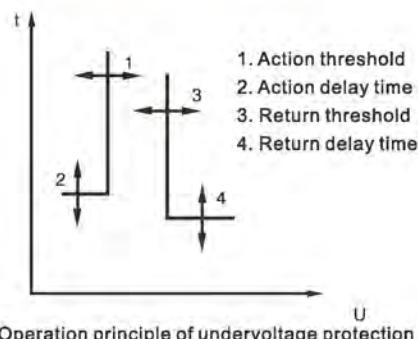

Regional interlocking diagram

Regional selective interlocking includes short-circuit interlocking and grounding interlocking. In the same power circuit with two or more upper and lower associated circuit breakers:

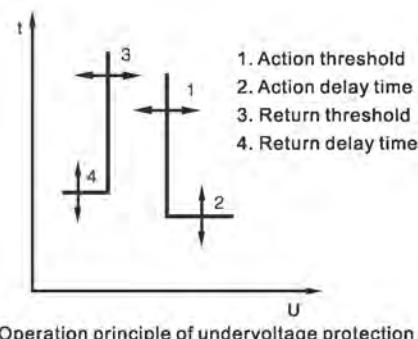

- When the short circuit or grounding fault occurs at the outlet side of the lower level circuit breaker (such as position ②), the lower level circuit breaker trips and sends the regional or interlocking trip signal to the higher level circuit breaker; - the upper level circuit breaker (1# circuit breaker) receives the regional interlocking trip signal, and delays according to the short circuit or grounding protection setting. If the fault current of the upper circuit breaker is eliminated during the delay process, the protection will return and the upper circuit breaker will not act; if the lower level circuit breaker trips, the fault current will not be eliminated. The upper circuit breaker acts according to the short circuit or grounding protection setting to cut off the fault line.
- When the short circuit or grounding fault occurs between the upper circuit breaker (1# circuit breaker) and the lower circuit breaker (2# ~ 4# circuit breaker) (such as position ①). The superior circuit breaker did not receive the regional interlocking signal, so it tripped instantaneously and cut off the fault line quickly.
- Parameter setting:
- At least one Di of superior circuit breaker is set as regional interlocking detection;
- At least one do of lower level circuit breaker is set as regional interlocking signal output.

### Voltage protection

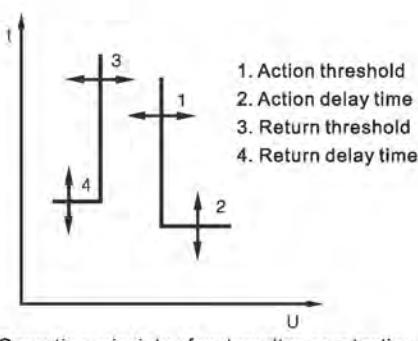

#### ■ Port undervoltage protection

- The intelligent controller measures the true effective value of the primary circuit voltage. When the three line voltages are less than the set value, that is, when the maximum value of the three line voltages is less than the set value of the under voltage protection, the under voltage protection acts; when the maximum value of the three line voltages is greater than the return value, the alarm action returns.
- Action characteristics: when the maximum voltage is less than the action threshold (1), the alarm or trip delay will be started; when the action delay time (2) arrives, the alarm or trip signal will be sent, and the undervoltage fault will act; when the maximum voltage value is greater than the return threshold value (3), the return delay will be started; when the return delay time (4) reaches, the alarm will be removed and the under voltage fault will return.

#### ■ Port overvoltage protection

- The intelligent controller measures the true RMS value of the primary circuit voltage. When the three line voltages are greater than the set value, that is, when the minimum value of the three line voltages is greater than the set value of the overvoltage protection, the over-voltage protection acts; when the three line voltages are less than the return value, the alarm action returns.
- Action characteristics: when the minimum line voltage is greater than the action threshold (1), the alarm or trip delay will be started; when the action delay time (2) arrives, the alarm or trip signal will be sent, and the overvoltage fault will act; when the execution mode is alarm, after the alarm action, when the minimum line voltage is less than the return threshold (3), the return delay will be started, and the alarm will be removed when the return delay time (4) is up Fault return.

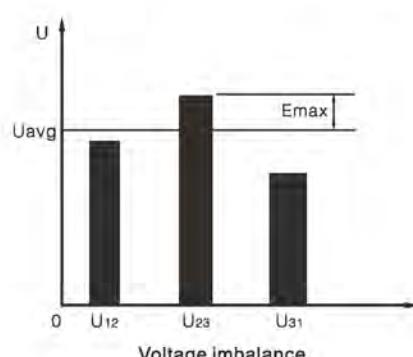

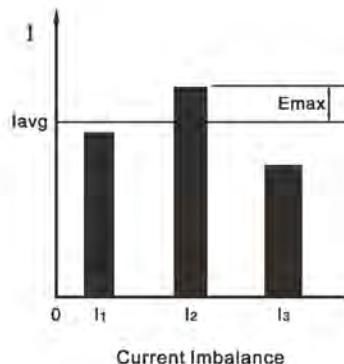

#### ■ Port voltage stability protection

- Voltage unbalance rate protection acts according to the unbalance rate of three line voltages. The intelligent controller measures the voltage unbalance rate. When the voltage unbalance rate is greater than the dynamic threshold value, the protection action will act; when the power imbalance rate is less than the return value, the alarm action will return.
- Action characteristics: when the voltage unbalance rate is greater than the action threshold (1), the alarm or trip delay will be started; when the action delay time (2) arrives, the alarm or trip signal will be sent, and the voltage imbalance rate will act in fault; when the execution mode is alarm, after the alarm action, when the voltage unbalance rate is less than the return threshold (3), the return delay will be started, and when the return delay time (4) reaches, it will be withdrawn In addition to the alarm, the voltage unbalance rate fault returns.
- Calculation method of voltage unbalance rate:

$$U_{unbal} = \frac{|E_{max}|}{U_{avg}} \times 100\% \quad U_{avg} = \frac{U_{12} + U_{23} + U_{31}}{3}$$

E<sub>max</sub>: the maximum difference between the line voltage and the average value.  
U<sub>avg</sub>: the average value of the sum of the three-phase line voltage values.

■ Current unbalance rate protection

□ The current unbalance rate protection is used to protect the phase break and three-phase current unbalance, and the protection action is based on the unbalance rate of three-phase current.

□ Calculation method of unbalance rate:

$$I_{unbal} = \frac{|E_{max}|}{I_{avg}} \times 100\% \quad I_{avg} = \frac{|I_1 + I_2 + I_3|}{3}$$

E<sub>max</sub>: the maximum difference between each phase current and I<sub>avg</sub>.

Lavg: is the average effective value of three-phase line current value.

■ Measurement of port harmonics

The intelligent controller can measure fundamental current, fundamental line voltage, fundamental phase voltage, fundamental power, 3-31 order odd harmonic current content (Hr<sub>ih</sub>), harmonic wave voltage content (hr<sub>uh</sub>), total harmonic current distortion rate [THDi, THD<sub>i</sub>], total harmonic voltage distortion rate [THDu, THD<sub>u</sub>]

Harmonic content (HR)

The ratio of the root mean square value of the H-th harmonic component to the root mean square value of the fundamental component in the periodic AC flow (expressed as a percentage).

The h-th harmonic current content is expressed in Hr<sub>ih</sub>.

$$HR|_h = \frac{|I_h|}{|I_{1-1}|} \times 100\%$$

Note: where I<sub>h</sub> is the H th harmonic current of phase a (root mean square value);

The H th harmonic voltage content is expressed in hr<sub>uh</sub>

$$HRU_h = \frac{U_h}{U_{1-1}} \times 100\%$$

Note: where I<sub>h</sub> is the h-th harmonic line voltage of A-B phase

Total harmonic distortion (THD, thd)

The ratio (THD) of the harmonic content in periodic AC flow to the root mean square value of its fundamental component is expressed as a percentage.

$$THDi = \frac{\sqrt{\sum_{h=2}^n I_h^2}}{|I_{1-1}|} \times 100\% \quad THDu = \frac{\sqrt{\sum_{h=2}^n U_h^2}}{|U_{1-1}|} \times 100\%$$

Note: in the formula, h is the H-th harmonic current (root mean square value) of phase a; uh is the H-th harmonic line voltage between A-B phases (root mean square value).

The ratio (thd) of the harmonic content in the periodic traffic flow to the root mean square value of the periodic traffic flow is expressed as a percentage.

$$thdi = \frac{\sqrt{\sum_{h=2}^n I_h^2}}{|I_{1-1}|} \times 100\% \quad thdu = \frac{\sqrt{\sum_{h=2}^n U_h^2}}{|U_{1-1}|} \times 100\%$$

Note: in the formula, I<sub>h</sub> is the H-th harmonic current of phase a (root mean square value); uh is the H-th harmonic line voltage between A-B phases (root mean square value).

# UNION ELECTRICS

## Intelligent Air Circuit Breaker

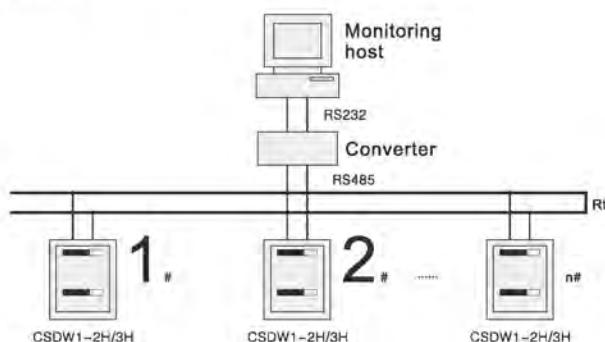

### Communication

The remote "four remote" function of circuit breaker can be realized through communication port. They are "remote control", "remote communication", "remote regulation" and "telemetry".

The communication protocol uses Modbus RTU, PROFIBUS DP or device mode and standard RS-485 interface. Baud rate and communication address can be set by programmer. The maximum wiring distance is 1.5km. One line can be connected with 250 communicable circuit breakers at the same time. The communication line is twisted shielded wire, which can be extended by adding medium relay.

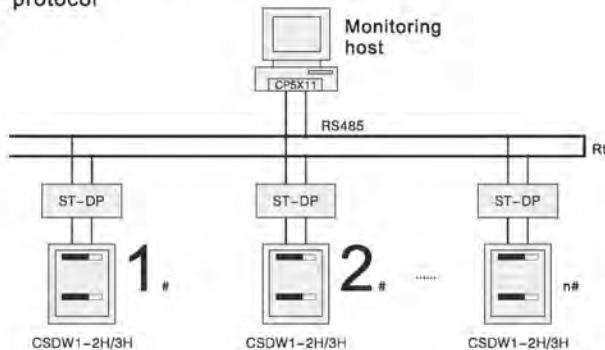

#### Communication network connection diagram 1

Application of modbus RTU protocol

#### Communication network connection diagram 2

Application of PROFIBUS DP protocol

ST-DP is the communication module, and the master station card is cp5x11 of SIEMENS company

Rt: network terminal resistance, generally 120 Ω

### Contact wear instructions

The current contact wear can be displayed on the intelligent controller panel. The factory display value of the controller is 100%, indicating that the contact is not worn. When the display value drops to 60%, an alarm signal will be sent to remind the user to take timely maintenance measures. After the contact is replaced, the initial wear value can be restored by setting.

### Self diagnosis

When the micro part of the intelligent controller breaks down or the ambient temperature around the microprocessor exceeds 80°C and 5°C, it will send out an alarm signal immediately.

## MCR and HSISC protection

- MCR function: when the circuit breaker is closing or the controller is energized and initialized, it can immediately turn to instantaneous opening in case of short-circuit short-time delay fault.
- HSISC function: when the circuit breaker is in normal operation, when the short-circuit current exceeds a certain limit value, the controller sends a signal to break the circuit breaker, which is not affected by the setting value of short-circuit instantaneous protection.

On off and over limit trip protection		
On / off	Motor threshold	15kA~ 100kA □ step1kA □
	Default setting value	50kA □ In≤2000A □ 60kA □ In □ 2000A □
Overrun trip	Motor threshold	15kA~ 100kA □ step1kA □
	Default setting value	65kA □ UNDW1-2000 □ 80kA □ UNDW1-3200/4000 □ 100kA □ UNDW1-6300 □

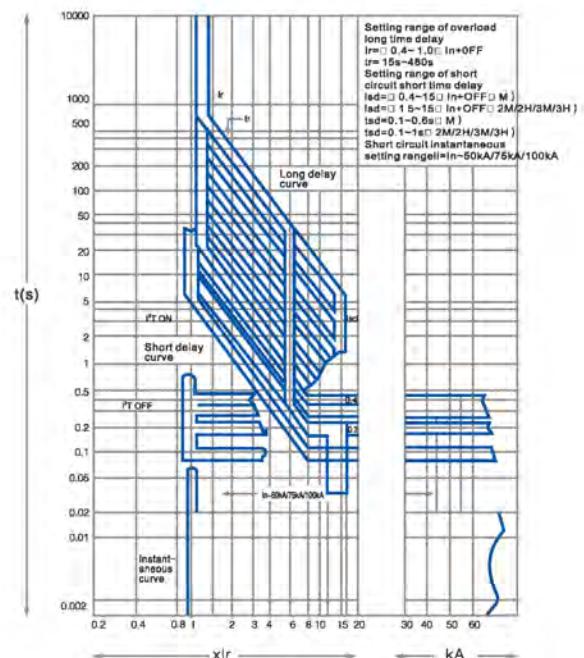

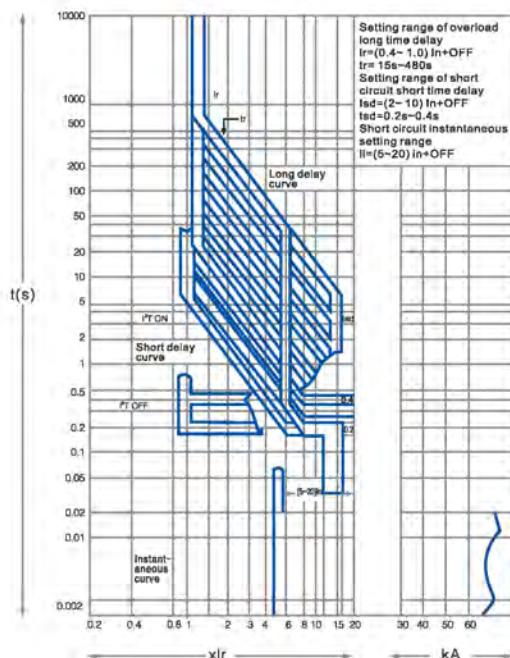

## Fault memory function

- After the circuit breaker breaks down in case of fault, the intelligent controller can display the fault category, fault phase, fault current value and breaking action time value.

## Signal contact output

The controller has the adjustable function of signal contact output, and the specific signal output can be contacted with our company.

On off and over limit trip protection				
	Contact 1	Contact 2	Contact 3	Contact 4
UNDW1-3M	Load monitoring 1	Load monitoring 2	Self diagnosis fault alarm	Fault trip
UNDW1- 2H/3H	Load monitoring 1	Load monitoring 2	Remote opening	Remote control switch on

## Intelligent Air Circuit Breaker

### Current unbalance protection

Overall range of unbalance rate $\delta$ modulation	40%~100%+OFF
Action characteristic or alarm characteristic	0.9 $\delta$ , no action
	1.1 $\delta$ , delay action
Delay time (s)	0.1~1.0s + off (OFF alarm only, no action,difference 0.1s)

### Over voltage protection

Action threshold (V)	1200 return threshold (step 1)	
Action delay time (s)	0.2~60 (in steps of 0.1)	
Return threshold (V)	Action threshold ~ 100 (step 1)	
Return delay time (s)	0.2~60 (step 0.1)	
Action or alarm characteristics	Voltage multiple ( $U_{max}$ / action threshold)	Agreed tripping or alarm time
	<0.9	Time limit action or alarm, contact (optional) output
	≥1.1	No action or alarm, no contact output

Note: the delay tolerance is more than 10%

### Leakage protection

Action current $I\Delta n$ (A)	0.5~30 (difference 0.1A)	
Delay Time $T\Delta n$ (s)	0~0.83	
Action characteristics	Current multiple $I/I\Delta n$	Agreed release time
	<0.8	No action
	≥1.0	Time limit action

Note: delay tolerance ±10%

### Action delay of leakage protection

Setting time (s)	0.06	0.08	0.17	0.25	0.33	0.42	0.50	0.58	0.67	0.75	0.83	Instantaneous
Fault current	Maximum breaking time (s)											
$I\Delta n$	0.36	0.50	1.00	1.50	2.00	2.50	3.00	3.50	4.00	4.50	5.00	
$2I\Delta n$	0.18	0.25	0.50	0.75	1.00	1.25	1.50	1.75	2.00	2.25	2.50	
$5I\Delta n$	0.072	0.10	0.20	0.30	0.40	0.50	0.60	0.70	0.80	0.90	1.00	0.04
$10I\Delta n$												

### Users have no special requirements, the intelligent controller is set as follows

Overload long time delay protection	lr	1In
	tr	60s
Short circuit short time delay protection	lsd	6In
	tsd	0.4s
Short circuit instantaneous protection	li	10In
Earth fault protection	lg	0.8In or 1200A (take the minimum)
Load monitoring	lc1	1In
	lc2	1In

Single phase earth leakage protection refers to metal grounding protection with fault current over several hundred amperes, which is generally used in neutral point direct grounding system. The controller is divided into two different protection modes, one of which is differential type (T). The controller can be divided into 3pt, 4PT and 3P + n according to the vector sum of three-phase current and neutral pole phase current. See Fig. 3, FIG. 4 and Fig. 5 respectively. The other is ground current type (W). The controller directly takes the output current signal of an additional current transformer between the neutral point of the main power supply and the ground for protection, and a neutral pole transformer or current transformer is added between the N line of the transformer and the PE level.

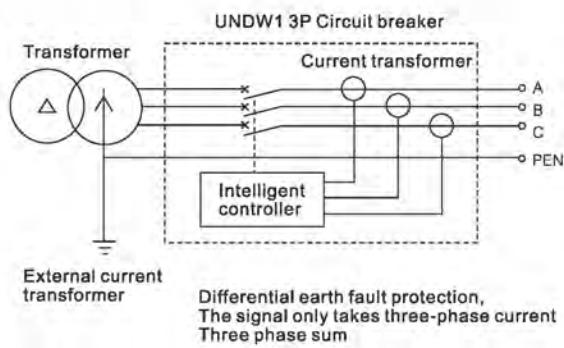

Figure 3. 3PT grounding difference type

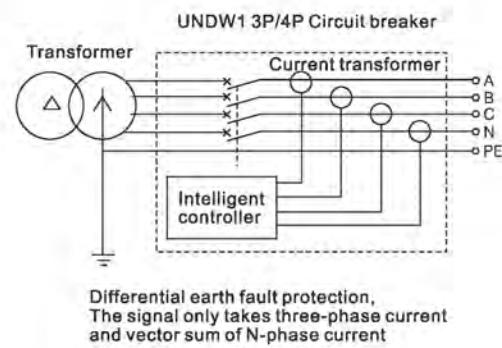

Figure 4. 4PT grounding difference type

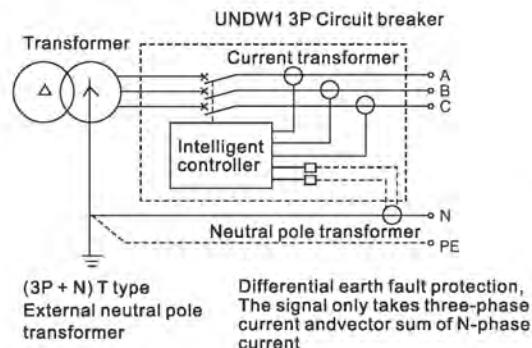

Figure 5 (3P + N) T type grounding difference type

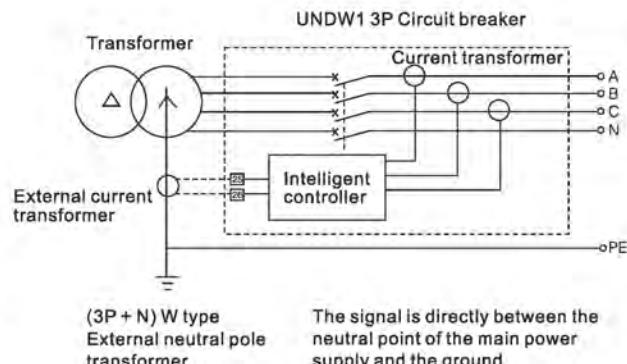

Figure 6 grounding current type

Leakage protection mainly takes signals through zero sequence transformer, with high flexibility, which is suitable for grounding protection of several ampere high resistance grounding systems and also for direct grounding systems. Generally, it only gives an alarm without tripping, and the circuit breaker can be disconnected when necessary. The connection mode is shown in Fig. 7 and Fig. 8. In addition, there are two kinds of load circuit (ZCT) or transformer grounding wire (ZT).

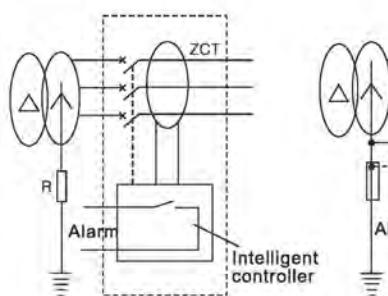

Figure 7 leakage load circuit type

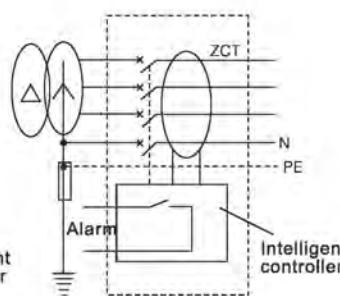

Figure 8 grounding type of leakage transformer

# UNION ELECTRICS

## Intelligent Air Circuit Breaker

### Power consumption (ambient temperature + 40°C)

The power consumption is the total loss measured when the circuit breaker passes through the rated current of the shell rating  $I_{nm}$ .

Model	Power consumption (W)	
	Fixed type	Drawer type
DW1-2000	240	360
DW1-3200	600	800
DW1-4000	420	560
DW1-6300	940	1220

### Lineup coefficient

The following table shows the continuous current carrying capacity of the circuit breaker under the heating conditions specified in GB / T14048.2 at ambient temperature.

Ambient temperature	+40°C	+45°C	+50°C	+55°C	+60°C
Continuous current carrying capacity	$I_{nm}=2000A$	1 $I_{nm}$	0.97 $I_{nm}$	0.91 $I_{nm}$	0.87 $I_{nm}$
	$I_{nm}=3200A$	1 $I_{nm}$	0.96 $I_{nm}$	0.90 $I_{nm}$	0.86 $I_{nm}$
	$I_{nm}=4000A$	1 $I_{nm}$	0.95 $I_{nm}$	0.89 $I_{nm}$	0.85 $I_{nm}$
	$I_{nm}=6300A$	1 $I_{nm}$	0.93 $I_{nm}$	0.87 $I_{nm}$	0.82 $I_{nm}$

If the altitude exceeds 2000m of the applicable working environment, the power frequency withstand voltage can be corrected according to the following table:

Altitude (m)	2000	3000	4000	5000
Power frequency withstand voltage (V)	3500	3150	2500	2000
Working current correction factor	1	0.93	0.88	0.82
Correction coefficient of short circuit breaking capacity	1	0.83	0.71	0.63

### Copper bar specification

Shell rating current $I_{nm}(A)$	Rated current $I_{n}(A)$	Copper bar specification	
		Number	Size(mm × mm)
2000	630	2	40×5
	800	2	50×5
	1000	2	60×5
	1250	3	80×5
	1600	2	100×5
	2000	3	100×5
3200	2000	3	100×5
	2500	4	100×5
	2900	3	100×10
	3200	3	100×10
	3600	4	100×10
	4000	4	100×10
6300	4000	4	100×10
	5000	6	100×10
	6300	8	100×10

The specifications in the table are the copper bar specifications adopted when the circuit breaker is in the ambient temperature up to 40°C and open installation and meets the heating conditions specified in GB / T14048.2.

## Electrical accessories

### Under-voltage Release

Note: in Thunderstorm prone areas or power grid with unstable power supply voltage, it is recommended to use the release with time delay to prevent the circuit breaker from tripping due to short-term voltage drop. The delay time is generally 0.3s, 0.5s, 0.7s, 1s, 3s, 5s, which can be selected by users.

Rated working voltage Ue (V)	AC400	AC230
Action voltage of under voltage release (V)	(0.35~0.7)Ue	
Action voltage of voltage loss release (V)	$\leq 0.35Ue$	
Undervoltage reliable closing voltage (V)	(0.85~1.1)Ue	
Reliable undervoltage, unable to switch on electric energy (V)	$\leq 0.35Ue$	
Power waste	12VA	

### Shunt release

The circuit breaker can be opened by remote control

Rated control supply voltage Ue (V)	AC400	AC230	DC220
Action voltage	(0.85~1.1)Ue		
Instantaneous current (A)	1.2	1	
Closing time (ms)	50ms $\pm$ 10ms		

### Closing electromagnet

After the end of energy storage, the closing electromagnet can release the energy stored in the operating mechanism instantaneously and make the circuit breaker close quickly.

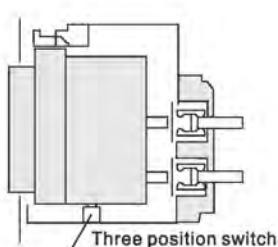

Rated control supply voltage Ue (V)	AC400	AC230	DC220
Action voltage	(0.85~1.1)Ue		
Instantaneous current (A)	1.2	1	
Closing time (ms)	50ms $\pm$ 10ms		

### Auxiliary Contact

Rated operating voltage Ue (V)	Agreed heating current Ith (A)	Rated control capacity
AC400		300VA
AC230	6	
DC220		60W

The standard type of auxiliary switch is 4 normally open and 4 normally closed transfer contacts

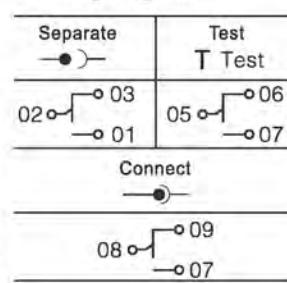

### Three position switch

The three position switch is mainly used for three position indication of drawer type circuit breaker, including separation, test and connection; the separation position is equipped with one normally open and one normally closed contact; the test position is equipped with one normally open and one normally closed contact; the connection position is equipped with one normally open and one normally closed contact.

Rated voltage Ue	Rated heating current Ith (A)
AC 50Hz	3
AC250V	
AC380V	1
DC	0.3
DC220V	
Use category	AC-15、AC-12 DC-12

### Wiring diagram

# UNION ELECTRICS

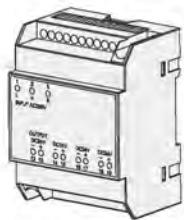

## Intelligent Air Circuit Breaker

### ◆ Motor Mechanism

The circuit breaker has the function of motor energy storage and automatic re storage (the circuit breaker can also store energy manually)

Frame	2000	3200/4000	6300
Action voltage (V)	230/400		
Power	85W	110W	150W
Energy storage time (s)	<7s		

### ◆ Power module

Input power supply: AC230V / AC400V / DC1 10V / dc220v (optional); when using grounding protection, communication, thermal memory functions or requiring the circuit breaker to maintain input and output signals in the opening state, auxiliary power supply must be provided.

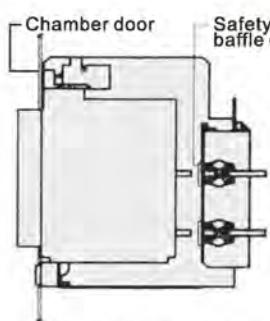

When DC intelligent controller is selected, DC power must be converted to DC24 V through DC power module, and then provided to intelligent controller.

### Electrical indicating device of drawer seat position

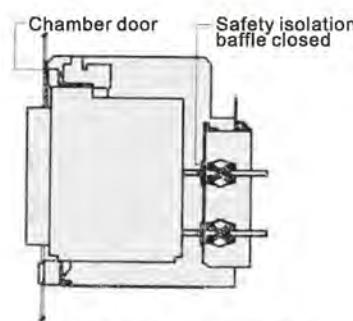

When the drawer type circuit breaker body and drawer base are in three positions of "separation", "test" and "connection", the electrical indication device of the three positions can output the electrical status signals corresponding to the three positions respectively, and the device is installed in the drawer.

Rated working voltage Ue (V)	230
Conventional heating current i <sub>the</sub> (A)	10
Rated working current I <sub>e</sub> (A)	1.5

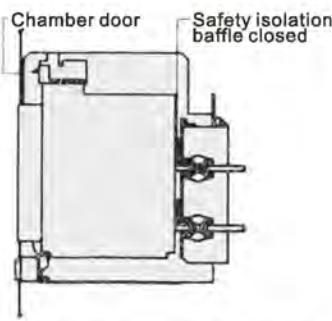

### "Separation" position state "test" position state "connection" position state

The main circuit and auxiliary circuit are all disconnected  
Safety baffle closed

The main circuit is disconnected and the auxiliary circuit is connected  
The safety baffle is closed and necessary tests can be carried out

Both the main circuit and the auxiliary circuit are connected  
Safety baffle open

## Connection, test and separation device of circuit breaker drawer seat

a b

- ◆ a. Padlock device (padlock provided by users)  
User drawer type locking "separation" or "test" or "connection" position;
- ◆ b. Interlocking and unlocking devices for separation, test and connection positions of circuit breaker are used for automatic searching and locking of forward and backward hand cranking handle; separation "and" test "Connection" position, to avoid the failure caused by the operator's manual handle operation is not in place.  
The locking position is released
- ◆ After the position red interlock is popped up, if you want to operate the handle again, you must first press the synonym of red interlocking device to operate the handle.

### ◆ Interphase Barrier

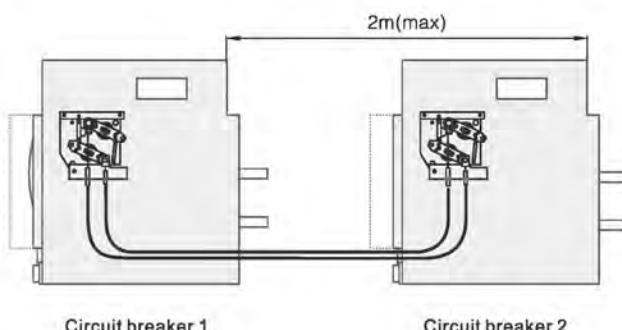

It is vertically installed between the terminal blocks of the Fixed type part of the drawer type circuit breaker to strengthen the insulation strength of the bus bar connection and prevent the arc from extending to the inside of the circuit breaker.

### ◆ Three locks and two keys

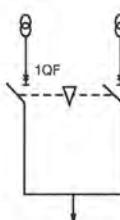

Three lock two key mechanical interlock is designed for three circuit breakers which are not adjacent. When two circuit breakers need to be closed, first insert the key into the lock hole of the two circuit breakers, and press the opening button to turn clockwise. At this time, the circuit breaker can be closed, but the key cannot be taken out. If you take out the key, you need to open the circuit breaker, press and hold the switch off button, and the key will turn anticlockwise and take it out. At this time, the circuit breaker will not be able to close.

### ◆ Mechanical interlock

Cable interlock of two horizontal circuit breakers or linkage interlocking of two stacked circuit breakers

# UNION ELECTRICS

## Intelligent Air Circuit Breaker

### Automatic Transfer Switch system

#### ◆ Main performance characteristics

1. All parameters and programmable ports are digitally adjusted, which can realize on-site and monitoring center setting. Important parameters adopt two-level password to prevent non professional personnel from misoperation;
2. Microprocessor as the core, LCD with backlight Chinese display, touch button operation;
3. It has the function of reclosing and reclosing after power failure. If the voltage of the other circuit is normal, it will switch to the other circuit automatically;
4. It is equipped with automatic / manual state switching, which can be forced to switch on and off in manual mode;
5. The closing output can be set as pulse or continuous output;
6. The field can be set as on load / no load mode for generator set commissioning operation;
7. It has the function of regularly starting and stopping the generator set, which can set single operation, once a month or once a week, and can set whether to run with load or not. It can control the cycle operation of two generating sets, and the operation time and interval shutdown time of the generator set can be set;
8. Eight LED indicating lights can clearly show the working state of switch and controller;
9. The range of DC power supply is very wide, and it can bear up to 50V instantaneously;
10. With switch switching delay (i.e. intermediate dwell time), the delay time can be set;
11. Can query the current controller status (including input port, overvoltage, undervoltage and other internal switch values);
12. With RS-485 isolated communication interface, baud rate and communication address can be set. The function of "remote control, telemetry and remote signaling" of dual power supply switching can be realized by using Modbus communication protocol;
13. It has real-time calendar and clock;
14. It has alarm function of switching fault, generator set fault and other general faults;
15. 40 historical records can be saved circularly, including the time of saving records, automatic / manual conversion, fault reason, switch state during conversion, power parameters, etc;
16. With oil engine start function, and can set the starting conditions of oil engine;
17. The input value can be connected with the auxiliary contact of the two-way transfer switch, and the output value is the passive contact of the relay output;
18. It has 5-channel configurable output and 4-channel configurable input;
19. With remote control locking function, the output control port remains unchanged in the original state under the locking state;
20. Protection grade: IP55 with waterproof rubber ring, IP42 without waterproof rubber ring.

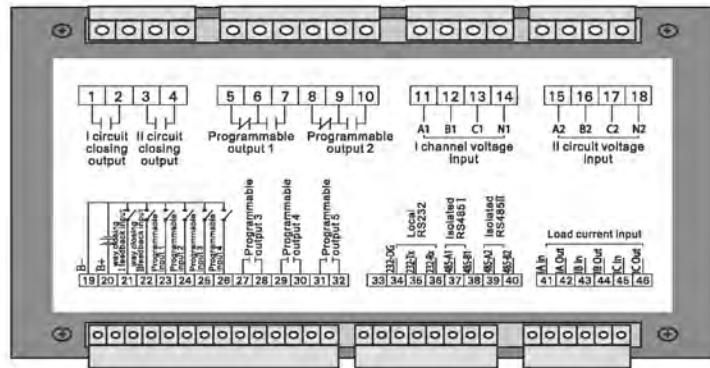

#### ◆ Technical parameter

1. Power supply: DC input: 8 ~ 35V (connected when oil engine start signal is required); AC input: from I, II circuit A / N phase voltage, as long as one of them has power, it can work, the voltage range is 160 ~ 280V;
2. Input three-phase voltage: 50 ~ 280V (single-phase) / 80 ~ 480V (three-phase) 50 Hz / 60Hz; input three-phase current: 0 ~ 5A (rated);
3. Overall power consumption < 3W (standby mode 2W)
4. Output capacity of closing and opening relay: 16A AC250V passive output;
5. Output capacity of programmable relay: 16A/10AAC250V passive output;
6. Digital input port: effective grounding;
7. Communication mode: standard configuration -- local RS232, - remote isolation RS485-I, MODBUS protocol. Users can select the second remote isolation RS485-II, and the function can be customized;
8. Working conditions: temperature -25°C ~ +70°C, humidity 20% ~ 90%;
9. Insulation strength: ac1.5kv/1min is added between input and output / power supply, and leakage current is 5mA;
10. Weight: 0.8 ~ 1.0kg.

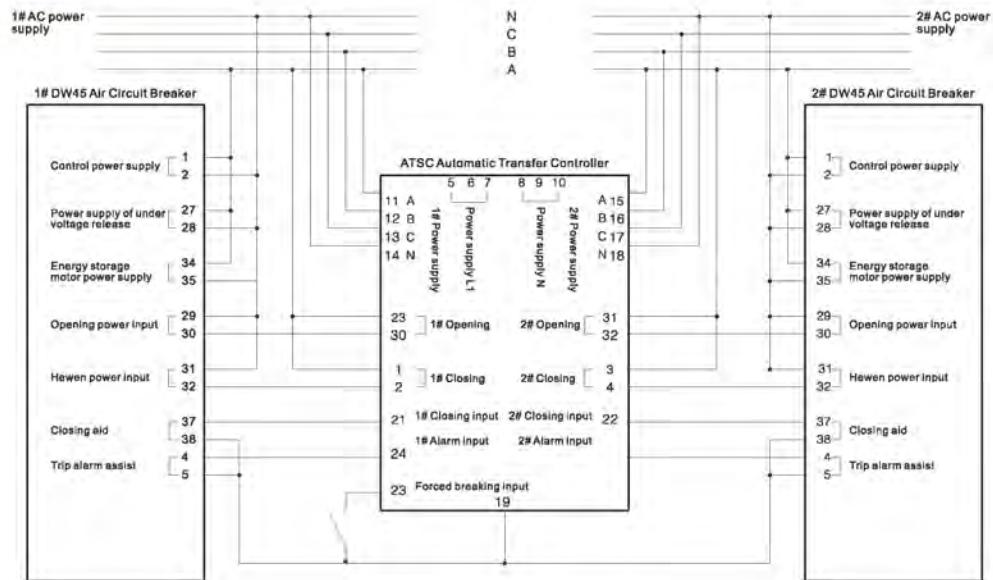

#### ◆ Communication parameters

1. Remote isolation RS485-I module address: 1-254, user can set the wave rate: 9600 (1200, 2400, 4800, 9600) 19200 57600bps Data bits: 8 bits Stop bit: 1 bit (1 bit, 2 bit) Check bit: no check (no check, even check, odd check)
2. Remote isolation RS485 II local isolation RS485 can be selected by users or customized to manufacturers

## Warning words for installation and use

In order to ensure the safety of your personal and electrical equipment, before the circuit breaker is put into operation, please make sure that:

- ◆The operation manual of circuit breaker must be carefully read before installation and use.
- ◆The circuit breaker must be used under normal working conditions.
- ◆Check whether the specifications of the circuit breaker meet the requirements before installation.
- ◆Before installation, measure the insulation resistance of the circuit breaker with a 500V megger. When the ambient air temperature is 20 °C and the soil temperature is 5 °C and the relative humidity is 50% ~ 70%, it should not be less than 500m<sup>2</sup>. Otherwise, it should be dried and used after the insulation resistance meets the requirements.
- ◆When the circuit breaker is installed, its mounting surface should be in a horizontal position and Fixed type with the m10bolts..
- ◆During installation, please pay attention that no conductive foreign matters fall into the circuit breaker.
- ◆During installation, the conductive bus connected with the circuit breaker shall be flat without additional mechanical stress.
- ◆During installation, the circuit breaker must be reliably protected and grounded with obvious grounding symbol.
- ◆After the circuit breaker is installed, the following operation tests must be carried out before the main circuit is powered on, so as to ensure that the circuit breaker can be formally powered on after the switch is normal.
- ◆Check whether there are foreign matters falling into the circuit breaker carefully. If any, it must be completely removed, and the circuit breaker must be protected and cleaned.
- ◆Connect the secondary circuit according to the relevant wiring diagram, and check whether the working voltage of shunt release, closing electromagnet, electric operating mechanism and intelligent controller is consistent with the actual power supply voltage, and then power on the secondary circuit.
- ◆After the electric operating mechanism stores energy, press the closing button (electric or manual) to close the circuit breaker.
- ◆Press the opening button (electric or manual) to open the circuit breaker.
- ◆Use the intelligent controller test function to make the circuit breaker open reliably. Press the reset button after the test.
- ◆For manual energy storage, pull the handle on the front panel up and down, and "energy storage" will be displayed on the panel after seven actions. And hear a "click" - sound, the end of the energy storage. The circuit breaker can be put into operation only after it is proved to be normal through the above steps test!!!

## Maintain

- ◆During use, lubricating oil should be injected into each rotating part regularly.
- ◆Clean the dust regularly to keep the circuit breaker well insulated.
- ◆Check the contact system regularly, especially after each short-circuit current breaking.
- ◆Check contents:
  - Whether the arc extinguishing cover is in good condition;
  - Whether the contact is good;
  - Whether the fasteners of each connection part are loose.

Mechanical interlock	Two circuit breakers	<input type="checkbox"/> Cable interlock	<input type="checkbox"/> Linkage interlock
Opening position locking	<input type="checkbox"/> One lock, one key	<input type="checkbox"/> Two lock, Two key	<input type="checkbox"/> Three lock, Two key <input type="checkbox"/> Five lock, Three key
Other options	<input type="checkbox"/> Interphase separator	<input type="checkbox"/> Door frame	<input type="checkbox"/> Signal output of connection test and separation position indication contact (1 N.O 1N.C.)
Wiring mode	<input type="checkbox"/> Standard horizontal outlet <input type="checkbox"/> Extended horizontal outlet <input type="checkbox"/> Standard positive outgoing line <input type="checkbox"/> Extended forward outgoing line <input type="checkbox"/> Standard vertical outlet <input type="checkbox"/> Extended vertical outlet		

Note: ■ - basic configuration; □ - optional configuration. If selected, mark in the port ✓

- 1) The products are normally ordered for distribution protection type;
- 2) If the user chooses the controller, additional functions can be added, and additional cost is required;
- 3) Due to the continuous improvement of product technology, technical parameters are subject to change without prior notice;
- 4) The copyright and interpretation right of this product manual belongs to chengshuo Electric Co., Ltd
